The MD&A was prepared as of May 30, 2025 and should be read in conjunction with the Company's unaudited condensed interim consolidated financial statements and corresponding notes for the three months ended March 31, 2025 and 2024 as well as the audited consolidated financial statements for the year ended December 31, 2024. The consolidated financial statements are prepared in accordance with International Financial Reporting Standards appropriate in the circumstances. All monetary amounts are expressed in United States dollars unless otherwise indicated.

Additional information related to the Company is available for view on SEDAR at www.sedarplus.com and at the Company's website located at www.pelotonminerals.com.

DESCRIPTION OF THE BUSINESS

The Company is a mineral exploration company focused on the acquisition and exploration of mineral resource properties, including lithium, uranium, rare earth minerals, gold and copper in the states of Nevada and Montana, USA.

Peloton's exploration portfolio includes a 100% interest in the North Elko Lithium Project (NELP) located in northeastern Nevada and immediately adjacent to the major lithium discovery by Surge Battery Metals Inc. in 2023. NELP is prospective for lithium, uranium and rare earth metals and is comprised of 442 mineral claims covering 37 square kilometers or 14.25 square miles.

The Company also owns a 100% interest in the Golden Trail and Independence Valley carlin style gold prospects in northeastern Nevada, and a non-controlling interest in the Boulder Copper Porphyry Project near Butte, Montana.

The Company is a reporting issuer in the Provinces of British Columbia and Ontario and its common shares trade on the Canadian Securities Exchange ("CSE") under the symbol PMC, and on the OTC QB Market in the United States under the trading symbol PMCCF.

COMPANY ACTIVITIES

On January 15, 2025, the Company announced that it had staked and filed for recording an additional 90 mineral claims at the NELP project, bringing the total number of NELP claims to 442 claims or approximately 37 square kilometers (14.25 square miles).

On February 27, 2025, the Company announced that it had received a preliminary geophysical report on NELP which shows an underlying layer, interpreted as clay-rich, across almost the entire property.

Exploration conducted up to Q1-2025 includes airborne hyperspectral imaging, a property wide soil geochemistry survey, geologic mapping, prospecting and sampling, X-Ray Diffraction analysis of over 500 surface samples, and the recent tTEM surface geophysical survey. A summary of results from each phase follows:

- Hyperspectral imaging data shows clay bearing layers outcropping at surface across almost the entire property

- Soil geochemistry analysis shows an elevated lithium anomaly (up to 18 times background) covering over 25+ square kilometers
- Geologic mapping suggests NELP is within an alkaline paleolake (ancient lake) environment, within a structural graben bounded by northerly-striking normal faults
- X-Ray Diffraction analysis shows NELP is within bedded alkaline lake sediments and volcanoclastic rocks. The mineralogy of the bedded volcanic rocks is consistent with magmas which are likely sources of lithium.
- tTEM surface geophysics shows an underlying layer, interpreted as clay rich, across almost the entire property

During Q1-2025, Peloton had one drill permit in place for the eastern part of NELP and has subsequently obtained a second drill permit for the central and western portions of NELP.
